FARM WAGES CONTINUE TO RISE

FARM EMPLOYMENT UP SLIGHTLY

JUL 14 1953

Farm wage rates around July 1 were about $1\frac{1}{2}$ percent higher than a year earlier, the Bureau of Agricultural Economics reported today. Wage rates were also up from the April 1 level of this year by about the same extent or slightly less than the usual rise during the period.

There were 11,132,000 people working on the Nation's farms during the week of June 21-27. This was over 100,000 more than a year earlier. A small decrease in the number of family workers from a year ago was more than offset by an increase in hired workers.

Farm wage rates of all types increased over April 1 of this year and nearly all types increased over those on July 1 of last year. Regional rates generally advanced slightly from April 1 although a few rates showed no change or small declines. A quarterly upturn from April to July is usual as the volume of higher paid seasonal help increases for harvesting vegetables, fruits, wheat and other seasonal operations.

The U. S. average farm wage rate per hour, without board and room was 89 cents, an increase of 2 cents per hour from a year previous and 4 cents more than on April 1 this year, which is about the usual rise for the quarter. Rates by regions ranged from \$.95 to \$1.09 per hour, except in the 3 southern regions where the averages were \$.54, \$.60, and \$.62 per hour.

Wage rates per day without board averaged \$5.30 on July 1 for the country as a whole, a gain of 10 cents per day over the same date in 1952. Regional averages showed a range from \$4.05 in the East South Central Region to \$8.30 in the West North Central States. The importance of skilled machinery operators, especially in the harvest of wheat, accounts in part for the relatively high average rate in the West North Central Region.

Farm work made good progress during June, except in the North from Minnesota, west to Washington and Oregon where cool, rainy weather delayed field operations and retarded crop growth and maturity. In other regions, the weather was generally hot and dry with severe drought conditions developing in many North Central and Southwestern areas.

The wheat crop was nearly all harvested in Oklahoma and Texas by the end of June and more than half of the Kansas acreage was harvested. Small grain harvest was active in most southern States during June and by the end of the month was getting started as far north as southern Nebraska and Illinois. Weather conditions were generally ideal for haying, which was a major activity in the northern half of the country. Cultivation of row crops was active in all areas during June and some corn was "laid by" in the southern part of the Corn Belt. Cotton chopping and hoeing were well along. The need for cotton choppers was below expectations in the drought areas and many of the foreign workers have gone home or moved on to other jobs.

Harvest of vegetables and early fruits was active in many States. Citrus harvest is still in progress in California but is completed in Florida. Peach harvest was well advanced in Georgia by the end of June and was getting under way farther north. Cherry picking was general in the earlier commercial areas. Potato harvest had moved as far north as Virginia and Maryland and harvest of

green peas for processing was active in the northern States in June. Tobacco harvesting was under way in the tobacco areas of the Deep South.

In addition to harvest, cultivation, and regular farm chores, other farm activities for the month consisted of spraying and dusting for control of insects, diseases and weeds; irrigation; thinning sugar beets and late fruits; sheep shearing in the northern range area; and hauling water and supplemental feed to livestock in some of the drought areas.

The 11,132,000 people working on farms the week of June 21-27 was 1 percent more than a year earlier for the country as a whole. All regions showed increases in total employment over June, 1952, except the West South Central States which declined 4 percent and the South Atlantic Region which showed practically no change. In many areas, the wet weather prior to June had delayed field operations and put farmers on a slightly later schedule than in 1952.

Total farm employment increased 364,000 from a month earlier, a slightly larger than normal seasonal increase. All regions reported increases from May except the South Central States where the usual seasonal decline took place. The greatest percentage increases occurred in the West North Central, Middle Atlantic and Mountain States.

The number of family workers on farms is estimated at 7,944,000, the lowest for the month in 29 years of record. This is about 50,000 less than a year ago. In most regions, the number of family workers was about the same as a year ago or slightly less. New England and the Mountain and Pacific States showed small increases.

The decrease of 6 percent for family workers from May to June was normal for the period. A larger than usual decrease in the South was offset by a larger than usual increase in the New England and Middle Atlantic States. Family employment usually declines in the South at the end of June as cotton chopping and hoeing near completion.

The number of hired farm workers during the survey week was 3,188,000, the largest number for June in the last 10 years, except for 1949. This is 5 percent or about 160,000 more than a year ago. All regions reported increases, except the West South Central with the greatest increases occurring in the West North Central and East South Central States.

The increase in hired farm workers from May to June was nearly 900,000, or 39 percent. The 5-year average increase in hired workers for the same period is 31 percent. All regions, except the West South Central, contributed to the increase. The greatest increases in these hired workers were in the North Central States where crop cultivation and haying became very active and in the South Atlantic States where harvest of early crops and cultivation is in progress.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

DEFINITIONS AND EXPLANATIONS

Employment

Farm employment estimates of the Bureau of Agricultural Economics cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide bench mark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case, the survey week is the next to the last full calendar week.

Employment concepts

All farm operators are counted as employed if they spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work, or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or households who meet these criteria of employment are called family workers. All persons doing one or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm he is counted as a hired worker.

Comparability with other data

The data on farm employment published by the Bureau of Agricultural Economics differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report on the Labor Force. The Bureau of Agricultural Economics collects information from the employer (the farmer) who reports the number of persons working on his farm during the week, regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over, who are in the civilian population and not in institutions.

The difference between the Bureau of Agricultural Economics and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria

of employment are included in the Bureau of Agricultural Economics estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the Bureau of Agricultural Economics on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural job; they are classified by Census as working in nonagricultural employment, but by the Bureau of Agricultural Economics as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the Bureau of Agricultural Economics but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the Bureau of Agricultural Economics does not include. Persons with "nonfarm" occupations who are working on farms, such as bookkeepers and typists, some persons in certain agricultural processing activities, and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau, but are not included by the Bureau of Agricultural Economics in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The Bureau of Agricultural Economics data relate to the last full calendar week ending at least one day before the end of the month while the Census Bureau information relates to the week containing the 8th of the month.

The Bureau of Agricultural Economics estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey bench mark data. The Bureau of the Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to a sampling variation and may differ from the results of a complete census.

Wage rates

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.
